Dr. Sky Connolly and his team of dedicated and experienced assistants and technicians have been striving to offer the highest quality of skin cancer surgery in New Mexico for the past nine years. Using a technique called Mohs Micrographic Surgery, Dr. Connolly is able to cure patients of skin cancer with extremely high cure rates while minimizing skin removal. This technique utilizes the microscope to aid in a high precision of skin cancer cure and normal tissue sparing.

In addition, Dr. Connolly performs reconstruction of the skin cancer removal site in order to maintain normal function and normal cosmetic outcome as possible. Consultations are scheduled before the Mohs surgery procedure, so that each patient's individual diagnosis, prognosis, treatment options and reconstruction scenarios can be discussed. Skin cancer is non-discriminatory and can occur in all age groups, racial diversities, and genders. Non-Melanoma skin cancers usually present as a pink, shiny, scaly, intermittently bleeding site on sun exposed skin. We feel that it is of utmost importance to provide our patients with the comfort in knowing that their concerns and needs will be served to their best interest.

Sky Connolly, MD, FAAD
